**Core Three Point Four**

July 2, 2021 -- Things here in the U.S. are in a far better place at the turn of midyear compared to where they began. Post holidays, and through mid-winter, COVID-19 was raging anew and widespread vaccination efforts just getting underway. Hundreds of thousands of new cases were being reported daily, and health care systems were again struggling to keep up. Despite the viral surge, and amid both continuing and new restrictions, the economy was recovering well, but unevenly, necessitating several new rounds of fiscal support to accompany the Fed's all-in stance for monetary policy.

Fast forward six months and the picture is very changed, if not completely. Despite a new Delta variant that threatens to become an echo surge, reported cases of coronavirus are running at levels comparable to the very first days of the outbreak.

Inoculation rates have slowed of late, but something on the order of 55% of eligible Americans have had at least one dose of a vaccine, and about 47% are fully vaccinated.

Spurred on by re-opening, removal of restriction and blasts of cash from the federal government, the economy again accelerated, with GDP growth running a 6.4% annual rate in the first quarter and a current estimate of over 7% in the second quarter. Although job growth overall may be a little less robust than some forecasts may have expected, about 3.2 million people have rejoined the workforce over the last six months, and claims for all forms of jobless assistance have retreated from well over 1 million claims every week to something less than half that.

Another facet that has changed appreciably in the last six months is the inflation picture. At the turn of...

the year, inflation was still tame, with inflation as measured by the Personal Consumption Expenditure series running at just a 1.4% rate in both "headline" and core reckonings. Five months on (June data not available until July’s end), these figures are 3.9% and 3.4%, with price increases now at 13- and 29-year highs, respectively.

With a strong economy in place and core prices now above the Fed's 2% target for the last couple of months, the Fed is starting to make rumblings about future changes in policy. At the turn of the year, the official stance was that rock-bottom rates and QE-style bond-buying programs would run indefinitely, and Fed members didn't expect to be raising the federal funds rate until perhaps 2024. Six months later, no changes have yet occurred, but the Fed is said to be discussing the tapering of bond buying (Our guess: later this year) and estimates of when a change to interest rate policy will come have advanced into 2023, with a majority of Fed members expecting not one but perhaps two increases in short-term rates by that time.

Change has come rapidly across some very important components of the current environment. Surprisingly, long-term interest rates and mortgage rates have been well behaved, rising from record lows to start the year, increasing by about a half-percentage point, then settling back to approximately the middle of this range and holding there for 12 weeks now. Although fewer remain in the eligible pool, this has continued to allow homeowners to refinance profitably or extract cash from their homes. For homebuyers, it has been both a blessing and a curse, since even as they can help to keep monthly payments relatively affordable, low rates continue to fuel demand for homes for which there is little supply, in turn pushing the prices of homes ever higher.

With challenges facing both new and existing home markets, sales of homes have been a little soggy of late, if still at historically sound levels. However, there is at least one indicator that suggests that sales may pick up a bit again, as the National Association of Realtors Pending Home Sales Index for May rose by 8% for the month. This measure of signed sales contracts presages the actual tally of homes sold by a month or two, since it takes time to get from contact signing to closing. Sales of existing homes have been generally cooling this year; after peaking at an annual rate of 6.73 million last October they have settled to May’s 5.8 million pace. The bump in signed contracts in May should push this figure up a bit by July, even if not all deals actually come to fruition.

Despite very stable mortgage rates, applications for mortgage credit dropped off by 6.9% in the week ending June 25. Requests for purchase-money mortgages slid by 4.8% while those for refinancing retreated by 8.2%. With conditions in mortgage markets largely unchanged, there doesn't seem to be any specific reason for the drop in requests for financing; looking back at the same weeks over the last five years it seems as though there is often a dip in applications in around this time of the year. Perhaps with many schools coming to the end of the academic year folks simple have other things to do, or perhaps vacations beckon. Whatever the reason, fundamentals for mortgages haven't changed all that much, but with the Independence Day holiday now upon us, we may not see an uptick in applications for a week or more yet.

The Silicon Valley’s Real estate market is a derivative of the local economy—it prospers and withers depending on how well the local innovation-based sector performs. The San Jose Mercury News tracks the performances of the largest 150 publicly traded companies headquartered in Silicon Valley through an index called the SV150, which may be found at www.mercurynews.com. Stocks are valued based on several criteria, but one of the more important criteria is a company’s future earnings. Therefore, I see the SV150 as a leading indicator for Silicon Valley’s real estate market.
